

Remove Volume to
Restore Volume

BeautiFill Balance

Our volume changes as we age. Often, we end up with a little too much volume in some places—and not enough in others.

BeautiFill™ moves fat cells from one place to another, restoring balance. BeautiFill uses safe, effective laser energy to gently transfer fat cells from places you don't want it, then uses it to fill the areas where extra volume is needed. Reduce volume to restore volume in one simple, in-office procedure. BeautiFill is the natural alternative to synthetic materials — with longer-lasting results!

What is BeautiFill?

BeautiFill is a simple in-office procedure designed to improve the contours of the face and body.

By utilizing safe laser technology, BeautiFill gently removes fat from unwanted areas.

If desired, the fat can be transferred to areas you wish to enhance, such as the face, hands, breasts and buttocks, also known as autologous fat transfer.

What is Autologous Fat Transfer?

Also known as fat grafting or fat injection, autologous fat transfer uses fat from your own body to add volume to areas that may be lacking. Autologous fat transfer provides a natural alternative to synthetic materials – with long lasting results.

The BeautiFill Difference

The crucial difference between BeautiFill and other fat transfer methods is how the fat is harvested. Although fat can be stubborn and hard to eliminate through diet and exercise, fat cells are quite fragile.

Traditional methods of fat harvesting can result in significant trauma to fat cells, leading to inconsistent results.

BeautiFill utilizes proprietary safe laser technology to gently retrieve fat cells, preserving their viability for re-implantation. A higher percentage of live fat cells correlates to a higher chance for cell survival following reimplantation.

Through clinical studies, fat harvested with BeautiFill has been shown to have, on average, greater than 90% viability.

Who Should Consider BeautiFill?

Every year, thousands of patients undergo autologous fat transfer for a variety of reasons – from adding youthful volume to the face to enhancing the curve of the buttocks.

A few reasons patients may consider BeautiFill:

- If you have facial areas that appear creased and sunken
- If you wish to improve the contours of your body
- If you wish to improve the appearance of your hands
- If you desire longer-lasting correction than can be provided by synthetic fillers

Is the Procedure Comfortable?

The BeautiFill procedure is typically performed in the office under local anesthesia, which means patients are awake and comfortable for the duration of the procedure. Some surgeons also perform BeautiFill in a traditional operating room setting.

Your physician will discuss anesthesia options during your consultation.

How is the procedure performed?

The BeautiFill procedure is a three step process.

Patients first undergo tumescent infiltration - this is where a solution containing the local anesthesia is placed the area where the fat will be harvested.

Then, safe laser energy is applied under the skin to gently loosen fat from problem areas.

The live harvested fat cells are then injected into areas where volume is desired.

Can I have body contouring without fat transfer?

Yes! BeautiFill is an excellent option for body contouring, with or without autologous fat transfer.

Unwanted fat can be removed from virtually any body area, including:

- Abdomen
- Inner Thighs
- Outer Thighs
- Back
- Love Handles
- Hips
- Arms
- And more!
